

Day 2 Instructor Run Sheet (120 minutes)

For the instructor only. Teach in Hindi. All written material stays in English. Day 2 has the highest risk of the week, because 30 to 60 computers install software at the same time with one instructor. Plan for it.

Before the class (do these first)

Do the clean-machine pilot from `INSTRUCTOR-PILOT-CHECKLIST.md`, on a Windows 11 Home PC that does not have Node.js installed. Time the installs.

Put the installers on the LAN share and on two spare USB sticks (in case the LAN fails). Write the share path on the board.

Put `setup-check.js`, the Day 2 `starter` folder and the Day 2 `done` folder on the same share.

Ask the lab attendant to make sure that students can run installers (administrator rights), and that Windows Update is not about to restart the machines.

Zoom VS Code and the terminal (**Ctrl and +**) so that the back row can read.

Timeline

Minutes	What	Notes
0 to 8	Check: installer folder, questions from the homework	Walk the room. Count the folders: every student should show <code>Workshop-Installers</code> . Fix missing files now (LAN or USB)
8 to 18	Talk: the terminal, PATH, what Node.js, npm and Git are	"Black window" demo on the projector. Show <code>cd</code> , <code>dir</code> , <code>mkdir</code>
18 to 45	Lab Parts 1 to 3: install Node.js and Git, restart VS Code, open the terminal	You install on the projector at the same time, one step at a time. Pause at every screen. Use Command Prompt, not PowerShell
45 to 55	Lab Part 4: <code>node -v</code> , <code>npm -v</code> , <code>git --version</code> , <code>setup-check.js</code>	Gate: do not go on until most students have four PASS lines. Use pods of six: the first student with all PASS helps the others in the pod
55 to 60	Lab Part 5: terminal practice (short)	<code>cd</code> , <code>dir</code> , <code>mkdir</code> , <code>echo</code> , <code>type</code> . Two minutes of Tab and Up arrow
60 to 70	Talk and Lab Part 6: JavaScript basics in the console	Live: variable, array, object, function
70 to 100	Lab Part 7: the Notes Board	Walk through sections 1 to 9 of <code>app.js</code> , a few lines at a time. Say "keep the data in one place, draw the page from the data"
100 to 108	Lab Part 8: About page details	Use copy-paste for <code>about.js</code> . Students type <code>student-details.js</code> and choose their own details
108 to 115	Lab Part 9: first server	Demo on the projector. Students follow if time allows
115 to 120	Quiz or homework, backup	

Cut lines (if the installs take long)

Installs are the priority. If they run past minute 55:

1. **Move Part 9 (hello server) to the start of Day 3.** This is the first thing to cut.
2. **Part 8:** students only edit their details in the `done` version of `student-details.js` and `about.js` (copy them in).
3. **Part 6:** do it as a demo on the projector only.
4. **Quiz:** move to the start of Day 3.

Do not cut: Parts 1 to 4 (everything installed and checked), the notes board in Part 7, and the backup.

If installs fail for some students

- Use the spare USB sticks for the installers.
- If a student's computer still fails, pair that student with a neighbour. They can write code on the neighbour's computer and fix their own installation after the class.
- Make a list of those students. Check them first on Day 3 morning.

What to say about the shared setup problems

- "A terminal reads PATH only when it starts. Close VS Code and open it again."
- "Use Command Prompt. If you see 'scripts disabled', you are in PowerShell."
- "Everything in the red text is a clue, not an insult. Read it."

Talk points for the JavaScript part

- JavaScript is how a page reacts: a click, a key, a form.
- The data is in an array. The page is drawn from the array.
- `textContent` is safe. `innerHTML` with user text is not. Show `<b>bold</b>` appearing as plain letters.
- After a refresh, notes are lost. This is on purpose, so that students feel the need for a server and a database.

Before ending the class

Everyone who could install has `node -v` showing 22 and four PASS lines.

Students with problems are on your list.

Students know to bring GitHub account details tomorrow, and to read the Day 3 theory once.

Backup done.

Notes for your own preparation tonight (Day 3)

- Day 3 needs `npm install express`. Check whether the lab network can reach the npm registry from 30 to 60 computers at the same time. If not, use the offline `node_modules` plan in `INSTRUCTOR-PILOT-CHECKLIST.md`.
- The Day 3 starter folder must be a copy of the Day 2 `done` folder.
