

Installer Kit: Files for Day 1 Collection and Day 2 Installation

For the instructor and the lab attendant.

On Day 1, students are told to collect a folder named `Workshop-Installers`. On Day 2, they install from it. This page lists what must be in that folder, and how to prepare it.

What goes into the kit

Item	Needed?	Rule for the version	File type	Where to get it
Node.js, Windows 64-bit installer	Required	The 24 LTS line. Use one single file for everyone	<code>.msi</code>	The official Node.js download page (nodejs.org). Choose version 24, LTS, Windows, x64
Git for Windows, 64-bit setup	Required	The latest stable release. One single file for everyone	<code>.exe</code>	The official Git download page (git-scm.com), Windows, 64-bit setup
<code>setup-check.js</code>	Required	The file in this folder	<code>.js</code>	This folder
PostgreSQL for Windows, 64-bit installer	Optional (the PostgreSQL track on Days 4 and 5)	To be decided after your pilot test	<code>.exe</code>	The official PostgreSQL download page (postgresql.org)
Visual Studio Code	Not needed	Already installed on every lab computer		

Fill in after you download

I could not read the Node.js download listing from where I prepared this folder, so the exact file names and versions are **not stated here**. Please fill in this table once you have the files, and keep a copy on the board.

Item	Exact file name	Version	Checksum (SHA-256)
Node.js 24 LTS			
Git for Windows			
PostgreSQL (optional)			

To check that a file is not damaged, open Command Prompt in the folder and type:

```
certutil -hashfile "file-name-here" SHA256
```

Compare the result with the checksum that the publisher shows on its download page.

Suggested folder layout

```
Workshop-Installers/
  node-24-lts/
    (the Node.js .msi file)
  git/
    (the Git for Windows .exe file)
  optional-postgresql/
    (the PostgreSQL installer, only if you decide to use it)
  setup-check.js
  READ-ME.txt (one line: "Install Node.js first, then Git. Ask your instructor if you
are stuck.")
```

For the lab attendant

1. Copy the `Workshop-Installers` folder to the LAN share. Make it **read only** for students.
2. From one student computer, open the share and copy the folder. Make sure it works.
3. Write the share path on the board on Day 1.
4. Keep **two spare USB sticks** with the same folder, in case the network fails on Day 2.
5. Ask: do the lab computers keep student files between days? Where can students keep a backup?
6. Confirm that students have **administrator rights** to run installers.
7. Ask that Windows Update does not restart the computers during class.

Notes

- Use **one** Node.js file for everyone. Different versions can behave differently.

- Do not use a "Current" release or a 32-bit file.
- Students install **Node.js first, then Git**. After installing, they close and reopen VS Code, then open a new terminal.
