

BCA 5-Day Web Technology Workshop: Build a Full-Stack Notes Board

A hands-on workshop for BCA second-year students at **Mandsaur University**. In five days of two hours each (10 hours in total), students build one small full-stack app, the **Notes Board**, and learn how the frontend, the backend, a database and hosting work together.

Instructor: Rahul Dhargar ([GitHub](#)) **Dates:** Tuesday 6 October 2026 to Saturday 10 October 2026

Language: The instructor teaches in Hindi. All written material is in simple English.

The plan at a glance

Day	Topic	Notes Board at the end of the day	Status in this folder
1	How the web works, HTML and CSS	A styled home page with sample notes, and an About page	Ready
2	Installing tools, the terminal, JavaScript	Adds and deletes notes in the browser, About page driven by one details file, first Node.js server	Ready
3	A server with Node.js and Express	Notes live on a server. Adding a note needs a password. Read access is public	Coming next
4	A database (SQLite) and Git	Notes are saved in a database. The code is on GitHub. Optional PostgreSQL track	Coming
5	Hosting on Render	The app runs on the internet with a public link	Coming

Success tiers (the pass condition is Tier 1):

1. **Tier 1:** the Notes Board works on the student's own computer (localhost).
2. **Tier 2:** the code is pushed to GitHub.
3. **Tier 3:** the app is live on Render with a public link.

What is in each day folder

Each `Day-N-...` folder has the same layout. Every document is given in **Markdown (.md)** and **PDF (.pdf)**.

Folder	For	What it holds
notes/	Students	The theory for the day, with a glossary and homework
lab/	Students	The step-by-step practical sheet
help/	Students	The "If you see this, do this" stuck sheet
starter/	Students	The code to start the day with. It contains everything finished up to the previous day
done/	Students and instructor	The finished code at the end of the day (a checkpoint to copy if a student is lost)

Day 3's `starter` folder is a copy of Day 2's `done` folder, and so on.

Quizzes are never committed to Git. They contain the answers. The `quiz/` folder inside `00-Instructor-Kit/` stays on the instructor's computer only, and `.gitignore` blocks every quiz file (also for days that are added later). A copy cloned from GitHub will not have the quizzes.

Other folders:

Folder	What it holds
<code>00-Instructor-Kit/</code>	Instructor only. <code>installer-kit/</code> (what to put on the LAN share for Day 2, and <code>setup-check.js</code>), <code>instructor-sheets/</code> (the minute-by-minute run sheet for each day, with cut lines and prompts), and <code>quiz/</code> (the 5-question quiz CSV and printable answer key for each day)
<code>tools/</code>	The PDF builder and the quiz builder

Other files:

- `INSTRUCTOR-PILOT-CHECKLIST.md` : tests to run on a clean lab computer before each risky day.

Decisions made

Topic	Decision
Frontend	HTML, CSS and JavaScript, no frameworks
Backend	Node.js 22 LTS with Express
Database	SQLite for everyone. PostgreSQL is an optional extra track for students who finish early
Project	A Notes Board
Editor	Visual Studio Code, already installed on the lab computers
Operating system	Windows 11 Home
Terminal	Command Prompt inside VS Code (PowerShell can block scripts)
Installation	Students collect installers on Day 1 and install on Day 2
Login	Reading notes is public. Adding a note needs one shared password, kept in an <code>.env</code> file and never committed to Git
About page	Students choose what to show. The instructor line is encouraged
Hosting	Render, Free web service, from GitHub
Quizzes	5 questions a day in Google Classroom, built from the CSV files in <code>00-Instructor-Kit/quiz/</code>

Things not verified yet

I prepared this folder without access to your lab. These items are **not tested** on a Windows 11 Home computer, and some are not confirmed at all. Use `INSTRUCTOR-PILOT-CHECKLIST.md`.

- The exact Node.js 22 LTS and Git for Windows file names and versions (the download listings could not be read).
- How the Node.js and Git installers look on Windows 11 Home. The lab sheet says "keep the default choices", plus a few screens that I know of. Check them.
- Whether Node.js 22's built-in SQLite module (`node:sqlite`) works without a flag on Windows. On Linux, with Node.js 22.22.0, it worked without a flag and printed an experimental warning. The Node.js documentation calls it experimental in 22.x.
- Render: whether a card or phone number is required for a Free web service, how many sign-ups from one network are allowed, and how long a deploy takes. Render's documentation says the filesystem of a Free web service is not kept on restart, redeploy or

spin-down, and that a free PostgreSQL database expires 30 days after creation.

- The Google Forms script (`tools/quiz-builder`), and the Google Classroom menu steps.

Rebuilding the PDFs

If you edit a Markdown file, rebuild its PDF. This needs Python, pandoc and the `playwright` package with its Chromium browser:

```
python tools/build_pdfs.py
```

Version control

This folder is a Git repository. Every file is committed, and the `.gitignore` file keeps `node_modules` , `.env` files and database files out of Git.
